- 1. How were the hyperparameter values selected?
- 2. How could the number of features have been reduced further?
- 3. Could any other information be collected about the policyholders that might have been useful in the model?
- 4. Are region code and policy sales channel necessary to include?
- 5. Why was the evaluation metric chosen over others?
- 6. How will the imbalanced classes impact the model performance?
- 7. How could the efficiency of the model training be improved?
- 8. Are there relationships between the categorical variables? How can they be identified?
- 9. Why were region code and policy sales channel encoded if they are numeric values?
- 10. How does the feature selection function mutual_info_classif work?
